Appendix 3: Income Requirements and Monthly Costs for 1, 2 and 3 bedroom properties in each District

Income multipliers and interest rates are as set out in 5.2 of the main report, and for rental values the single income requirement is based on rent being equal to 25% of gross income, with the same relationship between single and joint incomes as for purchase.

Table A3.1

Bromsgrove	Price	95% Mortgage	Single Income	Joint Income	Monthly Cost
1 bed at LQ	£68,163	£64,755	£18,501	£22,329	£352

Appendix 4: Average Property Prices 2009/10 and Price Increases

Sales Completed in 2009/10

The Land Registry data has been tabled to show the proportion of properties of each type, by price band, sold in 2009/10. While this is not necessarily representative of the housing stock as a whole, it certainly provides a valid comparison between the different areas, especially for those house types that might be expected to make some contribution to the needs of first time buyers.

All Property Types

Table A4.1: Proportions of All Sales by Price Band – Local Housing Market Area

Local Housing Market Area	<£100k	£100-120k	£120-140k	£140-160k	>£160k	Total Sales

Price increases

Data for 2009/10 is available for both districts and local housing market areas. Comparisons can be made for both geographical levels with last year but comparisons further than a year ago are only available by district.

The following tables provide a breakdown of price increases by property type for each district.

Detached Properties

Table A4.6: Average Prices for Detached Properties 2001-2009 by District

District	2001	2002	2003	2004	2005	2006	2007	2008	2009	Last 3 Years Change

Source: Annual Survey of Hours and Earnings (ONS) and Land Registry, 2010

The ratio of lower quartile house prices to lower quartile earnings has increased steadily over time until 2008 onwards where it has decreased in all districts and the county as a whole. The affordability ratio is highest in Malvern Hills, where the lower quartile house price is 7.98 times the lower quartile earnings. The ratio is lowest in Redditch, 6.42.

Table A4.11: Ratio of Median House Prices to Median Earnings by District, from 1997

District	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009

Source: Annual Survey of Hours and Earnings (ONS) and Land Registry, 2010

Similarly to Table A4.10, the ratio of median house prices to median earnings has increased over time up to 2007 before seeing a decline in 2008. The ratio is highest in Bromsgrove (8.04) and lowest in Redditch (6.21).

Appendix 5: Supply and Demand in the Social Sector

This section of the appendix provides more detail and an explanation of methodology to the data and information presented in Chapter 7.

Methodology for Assessing Demand

The number of applicants currently on the waiting list are identified by their current address and their household composition, and the household composition is translated into the size and type of property that would normally be most appropriate. This gives the number of applicants for each property type in each location. Those who are already in social rented housing are excluded, as are those who are deemed not to be currently in housing need.

The number of applicants are then compared with the number of properties of each type and in each location that were re-let in the last full year (to March 31st 2010) to establish a ratio of need to supply. This ratio is effectively the number of years that an applicant would have to wait for a suitable property at that annual rate of supply from re-lets alone.

The first letting of new or re-developed properties are excluded from the analysis, as they do not represent the rate at which vacancies can be expected to occur within the existing stock. Re-lets to existing, transferring, tenants are also excluded, as it is the property that they in turn vacate that is available for a new tenant, and to count both lettings would over-state the extent to which new tenants can be accommodated.

Where possible, the information has been collected at the level of individual parish or postcode sector, to enable a more fine-grained analysis to be carried out within any given Local Housing Market Area or District. By annual updating of these records, this could be done as and when required, and also for any small group of parishes or postcode sectors, to identify the particular and up to date priorities for a proposed development.

Annual updating will also smooth out any irregularities in the rate of supply, and also identify trends that allow for more accurate forecasting of future supply. This will be particularly important for finer grained analysis where the number of properties will be quite small and irregularities more pronounced. We now have three year's worth of data in order to make comparisons between ratios, which will give a basis for predicting future years.

Methodology for Projecting Supply from Social Re-lets

A major factor in arriving at the annual shortfall of affordable housing supply is the projected level of re-lets from within the existing stock. Given the size of the existing affordable housing stock (almost all of which is social rented) in relation to the number of new affordable dwellings which are added each year, a fairly small change in the rate at which the stock turns over can be more significant than a much larger change in the rate at which the stock is added to.

Government guidance suggests that a reasonable approach would be to make the projection on the basis of the average of the last three years, but it also suggests taking account of recent trends and notes that policies might seek to reduce turnover rates. In this monitoring, the projections have been made on the basis of the last three years average. It also notes the need to take account of the effect of Right-to-Buy in reducing the level of stock and hence the level of total re-lets.

While the cumulative effect of Right-to-Buy has clearly been large over the last 25 years or so, the smaller numbers now being experienced will make a negligible additional impact to overall stock levels and turnover in the next few years, so it was felt that no adjustment was required on this account.

The annual HSSA return allows for comparison with the previous 7 years, so a 8-year picture of letting activity can be obtained with previous years data. The following tables show how the level of re-lets to new tenants is arrived at. Lettings to existing tenants, through transfers and exchanges, are excluded, to avoid double counting, and new social rented supply is deducted as these do not represent stock turnover. (Future re-lets of new stock will effectively be cancelled out by lost re-lets through Right-to-Buy sales).

These tables are applied to the District-based projections set out in Chapter 13 of the monitoring report. For the Local Housing Market Area based projections, it was not possible to re-aggregate the information going back three years. Therefore the more detailed information provided for 2009/10 was compared and relative proportions applied to the district projections (Table 31) to produce local housing market area projections as shown in Table 34.
